

Introduction

- Healthy older adults have impaired episodic memory and intact semantic memory (Wingfield & Kahana, 2002)
- Healthy older adults have difficulty inhibiting the retrieval of semantic knowledge (Wynn et al., 2020)
- Memory encoding and retrieval brain states can be decoded from whole-brain activity patterns (Long & Kuhl, 2019; Smith, Moore & Long, 2022)
- Retrieving the past comes at the expense of encoding the present (Long & Kuhl, 2019)

Hypothesis

- Older adults retrieve semantic information at the expense of encoding, leading to diminished episodic memory

Participants

- Older adults: 60+ years old, N = 22
- Young adults: 18-35 years old, N = 36

Recognition memory test

Behavioral evidence of memory state shifts

Multivariate pattern analysis (MVPA) approach

Summary

- Older adults shift between memory encoding and retrieval
- Encoding and retrieval states can be distinguished using MVPA
- Older adults can engage in encoding and retrieval states, but unlike young adults, do not show increased evidence over time

Acknowledgements

This research was made possible with support from NIH/NCATS UL1TR003015 and KL2TR003016

Memory brain states can be decoded via MVPA

Memory brain states over time

Future directions

- Finish collecting older adult data
- Directly link memory brain states to memory performance
- Investigate memory brain states in middle-aged adults
- Assess which features drive classification
